[46]

```python
df['rating_norm'] = df['rating'] / df['rating'].max()

# Harga & Jarak: Cost (Makin rendah makin bagus)
# Kita gunakan (Nilai Minimal / Nilai Baris) agar nilai terkecil mendapat skor 1.0
df['harga_norm'] = df['harga'].min() / df['harga']
df['jarak_norm'] = df['jarak_km'].min() / df['jarak_km']

# 3. Hitung Score (Rata-rata)
df['score'] = (df['harga_norm'] + df['rating_norm'] + df['jarak_norm']) / 3

# 4. Sorting dan Ambil Minimal 5
df_sorted = df.sort_values(by='score', ascending=False).head(5)
```

[48]

```python
#-- OUTPUT FORMAT --#

for i, row in df_sorted.iterrows():
    print(f"{row['nama']}")
    print(f"harga: Rp. {int(row['harga']):,}".replace(',', '.'))
    print(f"rating: {row['rating']}")
    print(f"jarak: {row['jarak_km']} km")
    print(f"score: {round(row['score'], 3)}")
    print("-" * 30)
```
